

You reached the end of this learning module. You are now able to:

- Use input nodes to pull data from other sources so you can augment sensor data from multiple sources
- Use the HTTP node to create a webserver or setup a REST API so you can make data available to other systems
- Use a template node to format data and output it in the desired format
- Format a response received from HTTP input node, and use the HTTP node to send responses back
- Describe the value of a number nodes including input, output, and function nodes
- Use the report by exception node to control when messages should be sent down the flow
- Describe storage services within the cloud, or how to link external services, and how storing and analyzing data can provide value
